

**City-Dataset:**<https://docs.google.com/spreadsheets/d/1dk9kRwcMxj5USuJqxtfTD05S-aOUD6fzNzYW41dcpgc/edit?usp=sharing>

**Q1.** Query all columns for all American cities in the CITY table with populations larger than 100000. The CountryCode for America is USA.

The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2(17)
COUNTRYCODE	VARCHAR2(3)
DISTRICT	VARCHAR2(20)
POPULATION	NUMBER

Ans:    CREATE TABLE AmericanCities AS  
          SELECT \*  
          FROM CITY  
          WHERE CountryCode = 'USA' AND Population > 100000;

To query all columns for all American cities in the CITY table with populations larger than 100,000 where the CountryCode is 'USA', you can use the following SQL query:

```
SELECT *  
FROM CITY  
WHERE CountryCode = 'USA' AND Population > 100000;
```

**Q2.** Query the NAME field for all American cities in the CITY table with populations larger than 120000. The CountryCode for America is USA.  
The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2(17)
COUNTRYCODE	VARCHAR2(3)
DISTRICT	VARCHAR2(20)
POPULATION	NUMBER

Ans: `SELECT NAME  
FROM CITY  
WHERE CountryCode = 'USA'  
AND Population > 120000;`

**Q3.** Query all columns (attributes) for every row in the CITY table. The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2 ( 17 )
COUNTRYCODE	VARCHAR2 ( 3 )
DISTRICT	VARCHAR2 ( 20 )
POPULATION	NUMBER

Ans:   SELECT \*  
          FROM CITY;

**Q4.** Query all columns for a city in CITY with the ID 1661. The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2 ( 17 )
COUNTRYCODE	VARCHAR2 ( 3 )
DISTRICT	VARCHAR2 ( 20 )
POPULATION	NUMBER

Ans:   SELECT \*  
          FROM CITY  
          WHERE ID = 1661;

**Q5.** Query all attributes of every Japanese city in the CITY table. The COUNTRYCODE for Japan is JPN.  
The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2(17)
COUNTRYCODE	VARCHAR2(3)
DISTRICT	VARCHAR2(20)
POPULATION	NUMBER

ANS: SELECT \*  
FROM CITY  
WHERE CountryCode = 'JPN';

**Q6.** Query the names of all the Japanese cities in the CITY table. The COUNTRYCODE for Japan is JPN.  
The CITY table is described as follows:

**CITY**

Field	Type
ID	NUMBER
NAME	VARCHAR2(17)
COUNTRYCODE	VARCHAR2(3)
DISTRICT	VARCHAR2(20)
POPULATION	NUMBER

ANS: SELECT NAME  
FROM CITY  
WHERE CountryCode = 'JPN';

**station-table:**<https://docs.google.com/spreadsheets/d/1sHPhE7walQD5mL7ppFNqybvoOJY3E51N0cWYzhp2UH4/edit?usp=sharing>

**Q7.** Query a list of CITY and STATE from the STATION table.  
The STATION table is described as follows:

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

Ans:   SELECT CITY, STATE  
        FROM STATION;

**Q8.** Query a list of CITY names from STATION for cities that have an even ID number. Print the results in any order, but exclude duplicates from the answer.

The STATION table is described as follows:

where LAT\_N is the northern latitude and LONG\_W is the western longitude

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

Ans:   SELECT DISTINCT CITY  
        FROM STATION  
        WHERE MOD(ID, 2) = 0;

**Q9.** Find the difference between the total number of CITY entries in the table and the number of distinct CITY entries in the table.

The STATION table is described as follows:

STATION	
Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

For example, if there are three records in the table with CITY values 'New York', 'New York', 'Bengalaru', there are 2 different city names: 'New York' and 'Bengalaru'. The query returns , because total number of records - number of unique city names = 3-2 =1

ANS: SELECT COUNT(\*) - COUNT(DISTINCT CITY) AS Difference  
FROM STATION;

**Q10.** Query the two cities in STATION with the shortest and longest CITY names, as well as their respective lengths (i.e.: number of characters in the name). If there is more than one smallest or largest city, choose the one that comes first when ordered alphabetically.

The STATION table is described as follows:

STATION	
Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude. Sample

Input

For example, CITY has four entries: DEF, ABC, PQRS and WXY. Sample

Output

Ans: SELECT CITY, LENGTH(CITY)  
FROM STATION  
ORDER BY LENGTH(CITY), CITY  
LIMIT 1  
  
UNION  
  
SELECT CITY, LENGTH(CITY)  
FROM STATION  
ORDER BY LENGTH(CITY) DESC, CITY  
LIMIT 1;

ABC 3  
PQRS 4

**Hint -**

When ordered alphabetically, the CITY names are listed as ABC, DEF, PQRS, and WXY, with lengths and. The longest name is PQRS, but there are options for shortest named city. Choose ABC, because it comes first alphabetically.

Note

You can write two separate queries to get the desired output. It need not be a single query.

```
ANS: SELECT CITY, LENGTH(CITY)
      FROM STATION
      ORDER BY LENGTH(CITY), CITY
      LIMIT 1;

      SELECT CITY, LENGTH(CITY)
      FROM STATION
      ORDER BY LENGTH(CITY) DESC, CITY
      LIMIT 1;
```

**Q11.** Query the list of CITY names starting with vowels (i.e., a, e, i, o, or u) from STATION. Your result cannot contain duplicates.

Input Format

The STATION table is described as follows:

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

```
ANS: SELECT DISTINCT CITY
      FROM STATION
      WHERE CITY REGEXP '^[aeiouAEIOU]';
```

**Q12.** Query the list of CITY names ending with vowels (a, e, i, o, u) from STATION. Your result cannot contain duplicates.

Input Format

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

Ans: 

```
SELECT DISTINCT CITY
FROM STATION
WHERE CITY REGEXP '[aeiouAEIOU]$';
```

**Q13.** Query the list of CITY names from STATION that do not start with vowels. Your result cannot contain duplicates.

Input Format

The STATION table is described as follows:

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

Ans: 

```
SELECT DISTINCT CITY
FROM STATION
WHERE CITY NOT REGEXP '^[aeiouAEIOU]';
```

**Q14.** Query the list of CITY names from STATION that do not end with vowels. Your result cannot contain duplicates.

Input Format

The STATION table is described as follows:

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

ANS: 

```
SELECT DISTINCT CITY
FROM STATION
WHERE RIGHT(CITY, 1) NOT IN ('a', 'e', 'i', 'o', 'u', 'A', 'E', 'T', 'O', 'U');
```

**Q15.** Query the list of CITY names from STATION that either do not start with vowels or do not end with vowels. Your result cannot contain duplicates.

Input Format

The STATION table is described as follows:

**STATION**

Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

ANS: 

```
SELECT DISTINCT CITY
FROM STATION
WHERE CITY NOT REGEXP '^[aeiouAEIOU]' OR CITY NOT REGEXP '[aeiouAEIOU]$';
```

**Q16.** Query the list of CITY names from STATION that do not start with vowels and do not end with vowels. Your result cannot contain duplicates.

Input Format

The STATION table is described as follows:

STATION	
Field	Type
ID	NUMBER
CITY	VARCHAR2(21)
STATE	VARCHAR2(2)
LAT_N	NUMBER
LONG_W	NUMBER

where LAT\_N is the northern latitude and LONG\_W is the western longitude.

ANS: SELECT DISTINCT CITY  
FROM STATION  
WHERE CITY NOT REGEXP '^[aeiouAEIOU]' AND CITY NOT REGEXP '[aeiouAEIOU]\$';

**Q17.**

Table: Product

Column Name	Type
product_id	int
product_name	varchar
unit_price	int

product\_id is the primary key of this table.

Each row of this table indicates the name and the price of each product. Table: Sales

Column Name	Type
seller_id	int
product_id	int
buyer_id	int
sale_date	date
quantity	int
price	int

This table has no primary key, it can have repeated rows.

product\_id is a foreign key to the Product table.

Each row of this table contains some information about one sale.

Write an SQL query that reports the products that were only sold in the first quarter of 2019. That is, between 2019-01-01 and 2019-03-31 inclusive.

Return the result table in any order.

The query result format is in the following example.

Input:

Product table:

product_id	product_name	unit_price
1	S8	1000
2	G4	800
3	iPhone	1400

Sales table:

seller_id	product_id	buyer_id	sale_date	quantity	price
1	1	1	2019-01-21	2	2000
1	2	2	2019-02-17	1	800
2	2	3	2019-06-02	1	800
3	3	4	2019-05-13	2	2800

Output:

product_id	product_name
1	S8

Explanation:

The product with id 1 was only sold in the spring of 2019.

The product with id 2 was sold in the spring of 2019 but was also sold after the spring of 2019. The product with id 3 was sold after spring 2019.

We return only product 1 as it is the product that was only sold in the spring of 2019.

```
ANS: SELECT p.product_id, p.product_name
      FROM Product p
     LEFT JOIN Sales s ON p.product_id = s.product_id
    WHERE s.sale_date BETWEEN '2019-01-01' AND '2019-03-31'
    GROUP BY p.product_id, p.product_name
    HAVING COUNT(DISTINCT s.sale_date) = 1;
```

**Q18.**

Table: Views

Column Name	Type
article_id	int
author_id	int
viewer_id	int
view_date	date

There is no primary key for this table, it may have duplicate rows.

Each row of this table indicates that some viewer viewed an article (written by some author) on some date.

Note that equal author\_id and viewer\_id indicate the same person.

Write an SQL query to find all the authors that viewed at least one of their own articles. Return the result table sorted by id in ascending order.

The query result format is in the following example.

Input: Views

table:

article_id	author_id	viewer_id	view_date
1	3	5	2019-08-01
1	3	6	2019-08-02
2	7	7	2019-08-01
2	7	6	2019-08-02
4	7	1	2019-07-22
3	4	4	2019-07-21
3	4	4	2019-07-21

Output:

id
4
7

ANS:

```
SELECT DISTINCT author_id AS id
FROM Views
WHERE author_id = viewer_id
ORDER BY author_id;
```

**Q19.**

Table: Delivery

Column Name	Type
delivery_id	int
customer_id	int
order_date	date
customer_pref_delivery_date	date

delivery\_id is the primary key of this table.

The table holds information about food delivery to customers that make orders at some date and specify a preferred delivery date (on the same order date or after it).

If the customer's preferred delivery date is the same as the order date, then the order is called immediately; otherwise, it is called scheduled.

Write an SQL query to find the percentage of immediate orders in the table, rounded to 2 decimal places.

The query result format is in the following example.

Input: Delivery  
table:

delivery_id	customer_id	order_date	customer_pref_delivery_date
1	1	2019-08-01	2019-08-02
2	5	2019-08-02	2019-08-02
3	1	2019-08-11	2019-08-11
4	3	2019-08-24	2019-08-26
5	4	2019-08-21	2019-08-22
6	2	2019-08-11	2019-08-13

Output:

immediate_percentage
33.33

Explanation: The orders with delivery id 2 and 3 are immediate while the others are scheduled.

ANS:

```
SELECT ROUND((SUM(CASE WHEN order_date = customer_pref_delivery_date THEN 1 ELSE 0  
END) / COUNT(*)) * 100, 2) AS immediate_percentage  
FROM Delivery;
```

## Q20.

Table: Ads

Column Name	Type
ad_id	int
user_id	int
action	enum

(ad\_id, user\_id) is the primary key for this table.

Each row of this table contains the ID of an Ad, the ID of a user, and the action taken by this user regarding this Ad.

The action column is an ENUM type of ('Clicked', 'Viewed', 'Ignored').

A company is running Ads and wants to calculate the performance of each Ad. Performance of the Ad is measured using Click-Through Rate (CTR) where:

$$CTR = \begin{cases} 0, & \text{if Ad total clicks} + \text{Ad total views} = 0 \\ \frac{\text{Ad total clicks}}{\text{Ad total clicks} + \text{Ad total views}} \times 100, & \text{otherwise} \end{cases}$$

Write an SQL query to find the ctr of each Ad. Round ctr to two decimal points.

Return the result table ordered by ctr in descending order and by ad\_id in ascending order in case of a tie.

The query result format is in the following example.

Input:

Ads table:

ad_id	user_id	action
1	1	Clicked
2	2	Clicked
3	3	Viewed
5	5	Ignored
1	7	Ignored
2	7	Viewed
3	5	Clicked
1	4	Viewed
2	11	Viewed
1	2	Clicked

Output:

ad_id	ctr
1	66.67
3	50
2	33.33
5	0

Explanation:

for ad\_id = 1, ctr = (2/(2+1)) \* 100 = 66.67

for ad\_id = 2, ctr = (1/(1+2)) \* 100 = 33.33

for ad\_id = 3, ctr = (1/(1+1)) \* 100 = 50.00

for ad\_id = 5, ctr = 0.00, Note that ad\_id = 5 has no clicks or views. Note that we do not care about Ignored Ads.

```
ANS: SELECT ad_id,
       ROUND(
         IFNULL(
           (SUM(CASE WHEN action = 'Clicked' THEN 1 ELSE 0 END) / NULLIF(SUM(CASE
             WHEN action IN ('Clicked', 'Viewed') THEN 1 ELSE 0 END), 0)) * 100,
           0
         ),
       2
     ) AS ctr
FROM Ads
GROUP BY ad_id
HAVING SUM(CASE WHEN action IN ('Clicked', 'Viewed') THEN 1 ELSE 0 END) > 0
```

```
ORDER BY ctr DESC, ad_id ASC;
```

**Q21.**

Table: Employee

Column Name	Type
employee_id	int
team_id	int

employee\_id is the primary key for this table.

Each row of this table contains the ID of each employee and their respective team.

Write an SQL query to find the team size of each of the employees. Return result table in any order.

The query result format is in the following example.

```
ANS: SELECT e.employee_id, COUNT(e2.employee_id) AS team_size
      FROM Employee e
      LEFT JOIN Employee e2 ON e.team_id = e2.team_id
      GROUP BY e.employee_id;
```

Input:

Employee Table:

employee_id	team_id
1	8
2	8
3	8
4	7
5	9
6	9

Output:

employee_id	team_size
1	3
2	3
3	3
4	1
5	2
6	2

Explanation:

Employees with Id 1,2,3 are part of a team with team\_id = 8. An employee with Id 4 is part of a team with team\_id = 7.

Employees with Id 5,6 are part of a team with team\_id = 9.

**Q22.**

Table: Countries

Column Name	Type
country_id	int
country_name	varchar

country\_id is the primary key for this table.

Each row of this table contains the ID and the name of one country.

Table: Weather

Column Name	Type
country_id	int
weather_state	int
day	date

(country\_id, day) is the primary key for this table.

Each row of this table indicates the weather state in a country for one day.

Write an SQL query to find the type of weather in each country for November 2019. The type of weather is:

- Cold if the average weather\_state is less than or equal 15,
- Hot if the average weather\_state is greater than or equal to 25, and
- Warm otherwise. Return

result table in any order.

The query result format is in the following example.

Ans: **SELECT**

country,

**CASE**

WHEN AVG(weather\_state) <= 15 THEN 'Cold'

WHEN AVG(weather\_state) >= 25 THEN 'Hot'

ELSE 'Warm'

**END AS** weather\_type

**FROM** Weather

**WHERE** MONTH(date) = 11 AND YEAR(date) = 2019

**GROUP BY** country;

Input: Countries

table:

country_id	country_name
2	USA
3	Australia
7	Peru
5	China
8	Morocco
9	Spain

Weather table:

country_id	weather_state	day
2	15	2019-11-01
2	12	2019-10-28

2	12	2019-10-27
3	-2	2019-11-10
3	0	2019-11-11
3	3	2019-11-12
5	16	2019-11-07
5	18	2019-11-09
5	21	2019-11-23
7	25	2019-11-28
7	22	2019-12-01
7	20	2019-12-02
8	25	2019-11-05
8	27	2019-11-15
8	31	2019-11-25
9	7	2019-10-23
9	3	2019-12-23

Output:

country_name	weather_type
USA	Cold
Australia	Cold
Peru	Hot
Morocco	Hot
China	Warm

Explanation:

Average weather\_state in the USA in November is  $(15) / 1 = 15$  so the weather type is Cold.

Average weather\_state in Australia in November is  $(-2 + 0 + 3) / 3 = 0.333$  so the weather type is Cold. Average weather\_state in Peru in November is  $(25) / 1 = 25$  so the weather type is Hot.

The average weather\_state in China in November is  $(16 + 18 + 21) / 3 = 18.333$  so the weather type is warm.

Average weather\_state in Morocco in November is  $(25 + 27 + 31) / 3 = 27.667$  so the weather type is Hot.

We know nothing about the average weather\_state in Spain in November so we do not include it in the result table.

**Q23.**

Table: Prices

Column Name	Type
product_id	int
start_date	date
end_date	date
price	int

(product\_id, start\_date, end\_date) is the primary key for this table.

Each row of this table indicates the price of the product\_id in the period from start\_date to end\_date. For each product\_id there will be no two overlapping periods. That means there will be no two intersecting periods for the same product\_id.

Table: UnitsSold

Column Name	Type
product_id	int
purchase_date	date
units	int

There is no primary key for this table, it may contain duplicates.

Each row of this table indicates the date, units, and product\_id of each product sold.

Write an SQL query to find the average selling price for each product. average\_price should be rounded to 2 decimal places.

Return the result table in any order.

The query result format is in the following example.

Ans:     SELECT product\_id, ROUND(AVG(price), 2) AS average\_price  
          FROM Sales  
          GROUP BY product\_id;

Input: Prices

table:

product_id	start_date	end_date	price
1	2019-02-17	2019-02-28	5
1	2019-03-01	2019-03-22	20
2	2019-02-01	2019-02-20	15
2	2019-02-21	2019-03-31	30

UnitsSold table:

product_id	purchase_date	units
1	2019-02-25	100
1	2019-03-01	15
2	2019-02-10	200
2	2019-03-22	30

Output:

product_id	average_price
1	6.96
2	16.96

Explanation:

Average selling price = Total Price of Product / Number of products sold. Average selling price for product 1 =  $((100 * 5) + (15 * 20)) / 115 = 6.96$

Average selling price for product 2 =  $((200 * 15) + (30 * 30)) / 230 = 16.96$

#### Q24.

Table: Activity

Column Name	Type
player_id	int
device_id	int
event_date	date
games_played	int

(player\_id, event\_date) is the primary key of this table. This table shows the activity of players of some games.

Each row is a record of a player who logged in and played a number of games (possibly 0) before logging out on someday using some device.

Write an SQL query to report the first login date for each player. Return the result table in any order.

The query result format is in the following example.

```
ANS: SELECT player_id, MIN(login_date) AS first_login_date
      FROM Logins
      GROUP BY player_id;
```

Input: Activity  
table:

no_id	device_id	event_date	games_played
1	2	2016-03-01	5
1	2	2016-05-02	6
2	3	2017-06-25	1
3	1	2016-03-02	0
3	4	2018-07-03	5

Output:

player_id	first_login
1	2016-03-01
2	2017-06-25
3	2016-03-02

**Q25.**

Table: Activity

Column Name	Type
player_id	int
device_id	int
event_date	date
games_played	int

(player\_id, event\_date) is the primary key of this table. This table shows the activity of players of some games.

Each row is a record of a player who logged in and played a number of games (possibly 0) before logging out on someday using some device.

Write an SQL query to report the device that is first logged in for each player. Return the result table in any order.

The query result format is in the following example.

```
ANS: WITH FirstLogins AS (  
    SELECT player_id, MIN(login_date) AS first_login_date  
    FROM Logins  
    GROUP BY player_id  
)  
  
SELECT l.player_id, l.device AS first_login_device  
FROM Logins l  
JOIN FirstLogins fl ON l.player_id = fl.player_id AND l.login_date = fl.first_login_date;
```

Input: Activity

table:

player_id	device_id	event_date	games_played
1	2	2016-03-01	5
1	2	2016-05-02	6
2	3	2017-06-25	1
3	1	2016-03-02	0
3	4	2018-07-03	5

Output:

player_id	device_id
1	2
2	3
3	1

**Q26.**

Table: Products

Column Name	Type
product_id	int
product_name	varchar
product_category	varchar

product\_id is the primary key for this table.

This table contains data about the company's products.

Table: Orders

Column Name	Type
product_id	int
order_date	date
unit	int

There is no primary key for this table. It may have duplicate rows.

product\_id is a foreign key to the Products table.

unit is the number of products ordered in order\_date.

Write an SQL query to get the names of products that have at least 100 units ordered in February 2020 and their amount.

Return result table in any order.

The query result format is in the following example.

```
ANS: SELECT p.product_name, SUM(o.quantity * p.unit_price) AS amount
      FROM Products p
      JOIN Orders o ON p.product_id = o.product_id
      WHERE YEAR(o.order_date) = 2020 AND MONTH(o.order_date) = 2
      GROUP BY p.product_name
      HAVING SUM(o.quantity) >= 100;
```

Input: Products

table:

product_id	product_name	product_category
1	Leetcode Solutions	Book
2	Jewels of Stringology	Book
3	HP	Laptop
4	Lenovo	Laptop
5	Leetcode Kit	T-shirt

Orders table:

product_id	order_date	unit
1	2020-02-05	60
1	2020-02-10	70
2	2020-01-18	30
2	2020-02-11	80
3	2020-02-17	2
3	2020-02-24	3
4	2020-03-01	20
4	2020-03-04	30
4	2020-03-04	60
5	2020-02-25	50
5	2020-02-27	50
5	2020-03-01	50

Output:

product_name	unit
Leetcode Solutions	130
Leetcode Kit	100

Explanation:

Products with product\_id = 1 is ordered in February a total of  $(60 + 70) = 130$ .

Products with product\_id = 2 is ordered in February a total of 80.

Products with product\_id = 3 is ordered in February a total of  $(2 + 3) = 5$ . Products with product\_id = 4 was not ordered in February 2020.

Products with product\_id = 5 is ordered in February a total of  $(50 + 50) = 100$ .

**Q27.**

Table: Users

Column Name	Type
user_id	int
name	varchar
mail	varchar

user\_id is the primary key for this table.

This table contains information of the users signed up in a website. Some emails are invalid.

Write an SQL query to find the users who have valid emails. A

valid e-mail has a prefix name and a domain where:

- The prefix name is a string that may contain letters (upper or lower case), digits, underscore '\_', period '.', and/or dash '-'. The prefix name must start with a letter.
- The domain is '@leetcode.com'.

Return the result table in any order.

The query result format is in the following example.

ANS:

```
SELECT DISTINCT email AS email
FROM Users
WHERE REGEXP_LIKE(email, '[a-zA-Z][a-zA-Z0-9_-.]*@leetcode\.com$');
```

Input:

Users table:

user_id	name	mail
1	Winston	winston@leetcode.com
2	Jonathan	jonathanisgreat
3	Annabelle	bella-@leetcode.com
4	Sally	sally.come@leetcode.com
5	Marwan	quarz#2020@leetcode.com
6	David	david69@gmail.com
7	Shapiro	.shapo@leetcode.com

Output:

user_id	name	mail
1	Winston	winston@leetcode.com
3	Annabelle	bella-@leetcode.com
4	Sally	sally.come@leetcode.com

Explanation:

The mail of user 2 does not have a domain.

The mail of user 5 has the # sign which is not allowed. The

mail of user 6 does not have the leetcode domain. The mail of user 7 starts with a period.

## Q28.

Table: Customers

Column Name	Type
customer_id	int
name	varchar
country	varchar

customer\_id is the primary key for this table.

This table contains information about the customers in the company.

Table: Product

Column Name	Type
customer_id	int
name	varchar
country	varchar

product\_id is the primary key for this table.

This table contains information on the products in the company. price is the product cost.

Table: Orders

Column Name	Type
order_id	int
customer_id	int
product_id	int
order_date	date
quantity	int

order\_id is the primary key for this table.

This table contains information on customer orders.

customer\_id is the id of the customer who bought "quantity" products with id "product\_id". Order\_date is the date in format ('YYYY-MM-DD') when the order was shipped.

Write an SQL query to report the customer\_id and customer\_name of customers who have spent at least \$100 in each month of June and July 2020.

Return the result table in any order.

The query result format is in the following example

```
ANS: SELECT DISTINCT email AS email
FROM Users
WHERE REGEXP_LIKE(email, '^[a-zA-Z][a-zA-Z0-9_.-]*@leetcode\.com$');
```

Input: Customers

table:

customer_id	name	country
1	Winston	USA
2	Jonathan	Peru
3	Moustafa	Egypt

Product table:

product_id	description	price
10	LC Phone	300
20	LC T-Shirt	10
30	LC Book	45
40	LC Keychain	2

Orders table:

order_id	customer_id	product_id	order_date	quantity
1	1	10	2020-06-10	1
2	1	20	2020-07-01	1
3	1	30	2020-07-08	2
4	2	10	2020-06-15	2
5	2	40	2020-07-01	10
6	3	20	2020-06-24	2
7	3	30	2020-06-25	2
9	3	30	2020-05-08	3

Output:

customer_id	name
1	Winston

Explanation:

Winston spent \$300 ( $300 * 1$ ) in June and \$100 ( $10 * 1 + 45 * 2$ ) in July 2020.

Jonathan spent \$600 ( $300 * 2$ ) in June and \$20 ( $2 * 10$ ) in July 2020.

Moustafa spent \$110 ( $10 * 2 + 45 * 2$ ) in June and \$0 in July 2020.

**Q29.**

Table: TVProgram

Column Name	Type
program_date	date
content_id	int
channel	varchar

(program\_date, content\_id) is the primary key for this table. This table contains information about the programs on the TV. content\_id is the id of the program in some channel on the TV.

Table: Content

Column Name	Type
content_id	varchar
title	varchar
Kids_content	enum
content_type	varchar

content\_id is the primary key for this table.

Kids\_content is an enum that takes one of the values ('Y', 'N') where:

'Y' means content for kids, otherwise 'N' is not content for kids.  
content\_type is the category of the content as movies, series, etc.

Write an SQL query to report the distinct titles of the kid-friendly movies streamed in June 2020. Return the result table in any order.

The query result format is in the following example.

ANS:

```
SELECT customer_id, customer_name
FROM Customers
WHERE customer_id IN (
    SELECT customer_id
    FROM Orders
    WHERE YEAR(order_date) = 2020
    AND MONTH(order_date) IN (6, 7)
    GROUP BY customer_id
    HAVING SUM(order_amount) >= 100
    AND COUNT(DISTINCT MONTH(order_date)) = 2
);
```

Input: TVProgram

table:

program_date	content_id	channel
2020-06-10 08:00	1	LC-Channel
2020-05-11 12:00	2	LC-Channel
2020-05-12 12:00	3	LC-Channel
2020-05-13 14:00	4	Disney Ch
2020-06-18 14:00	4	Disney Ch
2020-07-15 16:00	5	Disney Ch

Content table:

content_id	title	Kids_content	content_type
1	Leetcode Movie	N	Movies
2	Alg. for Kids	Y	Series
3	Database Sols	N	Series
4	Aladdin	Y	Movies
5	Cinderella	Y	Movies

Output:

title
Aladdin

Explanation:

"Leetcode Movie" is not a content for kids. "Alg.

for Kids" is not a movie.

"Database Sols" is not a movie

"Alladin" is a movie, content for kids and was streamed in June 2020. "Cinderella" was not streamed in June 2020.

Table: NPV

Column Name	Type
id	int
year	int
npv	int

(id, year) is the primary key of this table.

The table has information about the id and the year of each inventory and the corresponding net present value.

Table: Queries

Column Name	Type
id	int
year	int

(id, year) is the primary key of this table.

The table has information about the id and the year of each inventory query.

Write an SQL query to find the npv of each query of the Queries table. Return the result table in any order.

The query result format is in the following example.

```
SELECT
  query_id,
  SUM(cash_flow / POW(1 + discount_rate, period)) AS npv
FROM Queries
GROUP BY query_id;
```

Input:NPV

table:

id	year	npv
1	2018	100
7	2020	30
13	2019	40
1	2019	113
2	2008	121
3	2009	12
11	2020	99
7	2019	0

Queries table:

id	year
1	2019
2	2008
3	2009
7	2018
7	2019
7	2020
13	2019

Output:

id	year	npv
1	2019	113
2	2008	121
3	2009	12
7	2018	0
7	2019	0
7	2020	30
13	2019	40

Explanation:

The npv value of (7, 2018) is not present in the NPV table, we consider it 0. The npv values of all other queries can be found in the NPV table.

### Q31.

Table: NPV

Column Name	Type
id	int
year	int
npv	int

(id, year) is the primary key of this table.

The table has information about the id and the year of each inventory and the corresponding net present value.

Table: Queries

Column Name	Type
id	int
year	int

(id, year) is the primary key of this table.

The table has information about the id and the year of each inventory query.

Write an SQL query to find the npv of each query of the Queries table. Return the result table in any order.

The query result format is in the following example.

```
ANS: SELECT
    query_id,
    SUM(CASE
        WHEN period = 0 THEN initial_investment
        ELSE cash_flow / POW(1 + discount_rate, period)
    END) AS npv
FROM Queries
GROUP BY query_id;
```

Input: NPV

table:

id	year	npv
1	2018	100
7	2020	30
13	2019	40
1	2019	113
2	2008	121
3	2009	12
11	2020	99
7	2019	0

Queries table:

id	year
1	2019
2	2008
3	2009
7	2018
7	2019
7	2020
13	2019

Output:

id	year	npv
1	2019	113
2	2008	121
3	2009	12
7	2018	0
7	2019	0
7	2020	30
13	2019	40

Explanation

The npv value of (7, 2018) is not present in the NPV table, we consider it 0. The npv values of all other queries can be found in the NPV table.

**Q32.**

Table: Employees

Column Name	Type
id	int
name	varchar

id is the primary key for this table.

Each row of this table contains the id and the name of an employee in a company.

Table: EmployeeUNI

Column Name	Type
id	int
unique_id	int

(id, unique\_id) is the primary key for this table.

Each row of this table contains the id and the corresponding unique id of an employee in the company.

Write an SQL query to show the unique ID of each user, If a user does not have a unique ID replace just show null. Return the result table in any order.

The query result format is in the following example.

ANS: SELECT DISTINCT user\_id AS unique\_id

FROM Users

UNION ALL

SELECT NULL AS unique\_id

FROM Users

WHERE user\_id IS NULL;

Input: Employees

table:

id	name
1	Alice
7	Bob
11	Meir
90	Winston
3	Jonathan

EmployeeUNI table:

id	unique_id
3	1
11	2
90	3

Output:

unique_id	name
null	Alice
null	Bob
2	Meir
3	Winston
1	Jonathan

Explanation:

Alice and Bob do not have a unique ID, We will show null instead. The unique ID of Meir is 2.

The unique ID of Winston is 3. The unique ID of Jonathan is 1.

### Q33.

Table: Users

Column Name	Type
id	int
name	varchar

id is the primary key for this table.

name is the name of the user.

Table: Rides

Column Name	Type
id	int
user_id	int
distance	int

id is the primary key for this table.

user\_id is the id of the user who travelled the distance "distance".

Write an SQL query to report the distance travelled by each user.

Return the result table ordered by travelled\_distance in descending order, if two or more users travelled the same distance, order them by their name in ascending order.

The query result format is in the following example.

ANS: SELECT  
  user\_id,  
  name,  
  SUM(distance) AS travelled\_distance  
  FROM Trips  
  GROUP BY user\_id, name  
  ORDER BY travelled\_distance DESC, name ASC;

Input: Users

table:

id	name
1	Alice
2	Bob
3	Alex
4	Donald

7	Lee
---	-----

13	Jonathan
19	Elvis

Rides table:

id	user_id	distance
1	1	120
2	2	317
3	3	222
4	7	100
5	13	312
6	19	50
7	7	120
8	19	400
9	7	230

Output:

name	travelled_distance
Elvis	450
Lee	450
Bob	317
Jonathan	312
Alex	222
Alice	120
Donald	0

Explanation:

Elvis and Lee travelled 450 miles, Elvis is the top traveller as his name is alphabetically smaller than Lee. Bob, Jonathan, Alex, and Alice have only one ride and we just order them by the total distances of the ride. Donald did not have any rides, the distance travelled by him is 0.

**Q34.**

Table: Products

Column Name	Type
product_id	int
product_name	varchar
product_category	varchar

product\_id is the primary key for this table.

This table contains data about the company's products.

Table: Orders

Column Name	Type
product_id	int
order_date	date
unit	int

There is no primary key for this table. It may have duplicate rows.

product\_id is a foreign key to the Products table.

unit is the number of products ordered in order\_date.

Write an SQL query to get the names of products that have at least 100 units ordered in February 2020 and their amount.

Return result table in any order.

The query result format is in the following example.

```
ANS: SELECT p.product_name, SUM(o.quantity * p.unit_price) AS amount
      FROM Products p
      JOIN OrderDetails o ON p.product_id = o.product_id
      JOIN Orders od ON od.order_id = o.order_id
      WHERE MONTH(od.order_date) = 2 AND YEAR(od.order_date) = 2020
      GROUP BY p.product_name
      HAVING SUM(o.quantity) >= 100;
```

Input: Products

table:

product_id	product_name	product_category
1	Leetcode Solutions	Book
2	Jewels of Stringology	Book
3	HP	Laptop
4	Lenovo	Laptop
5	Leetcode Kit	T-shirt

**Q35.**

Table: Movies

Column Name	Type
movie_id	int
title	varchar

movie\_id is the primary key for this table. The title is the name of the movie.

Table: Users

Column Name	Type
user_id	int
name	varchar

user\_id is the primary key for this table.

Table: MovieRating

Column Name	Type
movie_id	int
user_id	int
rating	int
created_at	date

(movie\_id, user\_id) is the primary key for this table.  
This table contains the rating of a movie by a user in their review.  
created\_at is the user's review date.

Write an SQL query to:

- Find the name of the user who has rated the greatest number of movies. In case of a tie, return the lexicographically smaller user name.
- Find the movie name with the highest average rating in February 2020. In case of a tie, return the lexicographically smaller movie name.

The query result format is in the following example.

ANS:

```
WITH UserRatings AS (  
  SELECT user_id, COUNT(DISTINCT movie_id) AS num Rated_movies  
  FROM MovieRatings  
  GROUP BY user_id  
)
```

```
TopUser AS (  
  SELECT user_id  
  FROM UserRatings  
  WHERE num Rated_movies = (  
    SELECT MAX(num Rated_movies)  
    FROM UserRatings  
  )  
  ORDER BY user_id  
  LIMIT 1  
)
```

```

MovieAverageRatings AS (
  SELECT movie_id, AVG(rating) AS avg_rating
  FROM MovieRatings
  WHERE MONTH(rating_date) = 2 AND YEAR(rating_date) = 2020
  GROUP BY movie_id
),

TopMovie AS (
  SELECT movie_id
  FROM MovieAverageRatings
  WHERE avg_rating = (
    SELECT MAX(avg_rating)
    FROM MovieAverageRatings
  )
  ORDER BY movie_id
  LIMIT 1
)

SELECT u.name AS user_name, m.movie_name
FROM Users u
JOIN TopUser tu ON u.user_id = tu.user_id
CROSS JOIN (
  SELECT movie_name
  FROM Movies
  WHERE movie_id = (SELECT movie_id FROM TopMovie)
) AS m;

```

Input:

Movies table:

movie_id	title
1	Avengers
2	Frozen 2
3	Joker

Users table:

user_id	name
1	Daniel
2	Monica
3	Maria
4	James

MovieRating table:

movie_id	user_id	rating	created_at
1	1	3	2020-01-12
1	2	4	2020-02-11
1	3	2	2020-02-12
1	4	1	2020-01-01
2	1	5	2020-02-17
2	2	2	2020-02-01
2	3	2	2020-03-01
3	1	3	2020-02-22
3	2	4	2020-02-25

Output:

results
Daniel
Frozen 2

Explanation:

Daniel and Monica have rated 3 movies ("Avengers", "Frozen 2" and "Joker") but Daniel is smaller lexicographically.

Frozen 2 and Joker have a rating average of 3.5 in February but Frozen 2 is smaller lexicographically.

**Q36.**

Table: Users

Column Name	Type
id	int
name	varchar

id is the primary key for this table.

name is the name of the user.

Table: Rides

Column Name	Type
id	int
user_id	int
distance	int

id is the primary key for this table.

user\_id is the id of the user who travelled the distance "distance".

Write an SQL query to report the distance travelled by each user.

Return the result table ordered by travelled\_distance in descending order, if two or more users travelled the same distance, order them by their name in ascending order.

The query result format is in the following example.

```
ANS: SELECT user_id, name, SUM(distance) AS travelled_distance
FROM Users
GROUP BY user_id, name
ORDER BY travelled_distance DESC, name ASC;
```

Input: Users

table:

id	name
1	Alice
2	Bob
3	Alex
4	Donald
7	Lee
13	Jonathan
19	Elvis

Rides table:

id	user_id	distance
1	1	120
2	2	317
3	3	222
4	7	100
5	13	312
6	19	50

7	7	120
8	19	400
9	7	230

Output:

name	travelled_distance
Elvis	450
Lee	450
Bob	317
Jonathan	312
Alex	222
Alice	120
Donald	0

Explanation:

Elvis and Lee travelled 450 miles, Elvis is the top traveller as his name is alphabetically smaller than Lee. Bob, Jonathan, Alex, and Alice have only one ride and we just order them by the total distances of the ride. Donald did not have any rides, the distance travelled by him is 0.

### Q37.

Table: Employees

Column Name	Type
id	int
name	varchar

id is the primary key for this table.

Each row of this table contains the id and the name of an employee in a company.

Table: EmployeeUNI

Column Name	Type
id	int
unique_id	int

(id, unique\_id) is the primary key for this table.

Each row of this table contains the id and the corresponding unique id of an employee in the company.

The query result format is in the following example.

Input:

Employees table:

id	name
1	Alice
7	Bob
11	Meir
90	Winston
3	Jonathan

EmployeeUNI table:

id	unique_id
3	1
11	2
90	3

Output:

unique_id	name
null	Alice
null	Bob
2	Meir
3	Winston
1	Jonathan

Explanation:

Alice and Bob do not have a unique ID, We will show null instead. The unique ID of Meir is 2.

The unique ID of Winston is 3. The unique ID of Jonathan is 1.

**Q38.**

Table: Departments

Column Name	Type
id	int
name	varchar

id is the primary key of this table.

The table has information about the id of each department of a university.

Table: Students

Column Name	Type
id	int
name	varchar
department_id	int

id is the primary key of this table.

The table has information about the id of each student at a university and the id of the department he/she studies at.

Write an SQL query to find the id and the name of all students who are enrolled in departments that no longer exist.

Return the result table in any order.

The query result format is in the following example.

Input: Departments

table:

id	name
1	Electrical Engineering
7	Computer Engineering
13	Business Administration

Students table:

id	name	department_id
23	Alice	1
1	Bob	7
5	Jennifer	13
2	John	14
4	Jasmine	77
3	Steve	74
6	Luis	1
8	Jonathan	7
7	Daiana	33
11	Madelynn	1

Output:

id	name
2	John
7	Daiana
4	Jasmine
3	Steve

Explanation:

John, Daiana, Steve, and Jasmine are enrolled in departments 14, 33, 74, and 77 respectively. Department 14, 33, 74, and 77 do not exist in the Departments table.

### Q39.

Table: Calls

Column Name	Type
from_id	int
to_id	int
duration	int

This table does not have a primary key, it may contain duplicates.

This table contains the duration of a phone call between from\_id and to\_id. from\_id != to\_id

Write an SQL query to report the number of calls and the total call duration between each pair of distinct persons (person1, person2) where person1 < person2.

Return the result table in any order.

The query result format is in the following example.

Ans:

```
SELECT
CASE WHEN caller_id < receiver_id THEN caller_id ELSE receiver_id END AS
person1,
CASE WHEN caller_id < receiver_id THEN receiver_id ELSE caller_id END AS
person2,
COUNT(*) AS number_of_calls,
SUM(call_duration) AS total_duration
FROM Calls
GROUP BY person1, person2
ORDER BY person1, person2;
```

Input: Calls

table:

from_id	to_id	duration
1	2	59
2	1	11
1	3	20
3	4	100
3	4	200
3	4	200
4	3	499

Output:

person1	person2	call_count	total_duration
1	2	2	70
1	3	1	20
3	4	4	999

Explanation:

Users 1 and 2 had 2 calls and the total duration is 70 (59 + 11).

Users 1 and 3 had 1 call and the total duration is 20.

Users 3 and 4 had 4 calls and the total duration is 999 (100 + 200 + 200 + 499).

#### Q40.

Table: Prices

Column Name	Type
product_id	int
start_date	date
end_date	date
price	int

(product\_id, start\_date, end\_date) is the primary key for this table.

Each row of this table indicates the price of the product\_id in the period from start\_date to end\_date. For each product\_id there will be no two overlapping periods. That means there will be no two intersecting periods for the same product\_id.

Table: UnitsSold

Column Name	Type
product_id	int
purchase_date	date
units	int

There is no primary key for this table, it may contain duplicates.

Each row of this table indicates the date, units, and product\_id of each product sold.

Write an SQL query to find the average selling price for each product. average\_price should be rounded to 2 decimal places.

Return the result table in any order.

The query result format is in the following example.

ANS: 

```
SELECT product_id, ROUND(AVG(price), 2) AS average_price
FROM Sales
GROUP BY product_id;
```

Input: Prices

table:

product_id	start_date	end_date	price
1	2019-02-17	2019-02-28	5
1	2019-03-01	2019-03-22	20
2	2019-02-01	2019-02-20	15
2	2019-02-21	2019-03-31	30

UnitsSold table:

product_id	purchase_date	units
1	2019-02-25	100
1	2019-03-01	15
2	2019-02-10	200
2	2019-03-22	30

Output:

product_id	average_price
1	6.96
2	16.96

Explanation:

Average selling price = Total Price of Product / Number of products sold. Average selling price for product 1 =  $((100 * 5) + (15 * 20)) / 115 = 6.96$

Average selling price for product 2 =  $((200 * 15) + (30 * 30)) / 230 = 16.96$

#### Q41.

Table: Warehouse

Column Name	Type
name	varchar
product_id	int
units	int

(name, product\_id) is the primary key for this table.

Each row of this table contains the information of the products in each warehouse.

Table: Products

Column Name	Type
product_id	int
product_name	varchar
Width	int
Length	int
Height	int

product\_id is the primary key for this table.

Each row of this table contains information about the product dimensions (Width, Length, and Height) in feet of each product.

Write an SQL query to report the number of cubic feet of volume the inventory occupies in each warehouse.

Return the result table in any order.

The query result format is in the following example.

```
SELECT warehouse_id, SUM(length * width * height) AS volume
FROM Inventory
GROUP BY warehouse_id;
```

Input: Warehouse  
table:

name	product_id	units
LCHouse1	1	1
LCHouse1	2	10
LCHouse1	3	5
LCHouse2	1	2
LCHouse2	2	2
LCHouse3	4	1

Products table:

product_id	product_name	Width	Length	Height
1	LC-TV	5	50	40
2	LC-KeyChain	5	5	5
3	LC-Phone	2	10	10
4	LC-T-Shirt	4	10	20

Output:

warehouse_name	volume
LCHouse1	12250
LCHouse2	20250
LCHouse3	800

**Q42.**

Table: Sales

Column Name	Type
sale_date	date
fruit	enum
sold_num	int

(sale\_date, fruit) is the primary key for this table.

This table contains the sales of "apples" and "oranges" sold each day.

Write an SQL query to report the difference between the number of apples and oranges sold each day. Return the result table ordered by sale\_date.

The query result format is in the following example.

```
ANS: SELECT sale_date, SUM(CASE WHEN fruit = 'apples' THEN quantity ELSE 0 END) -  
      SUM(CASE WHEN fruit = 'oranges' THEN quantity ELSE 0 END) AS diff  
FROM Sales  
GROUP BY sale_date  
ORDER BY sale_date;
```

Input:

Sales table:

sale_date	fruit	sold_num
2020-05-01	apples	10
2020-05-01	oranges	8
2020-05-02	apples	15
2020-05-02	oranges	15
2020-05-03	apples	20
2020-05-03	oranges	0
2020-05-04	apples	15
2020-05-04	oranges	16

Output:

sale_date	diff
2020-05-01	2
2020-05-02	0
2020-05-03	20
2020-05-04	-1

Explanation:

Day 2020-05-01, 10 apples and 8 oranges were sold (Difference  $10 - 8 = 2$ ).

Day 2020-05-02, 15 apples and 15 oranges were sold (Difference  $15 - 15 = 0$ ).

Day 2020-05-03, 20 apples and 0 oranges were sold (Difference  $20 - 0 = 20$ ).

Day 2020-05-04, 15 apples and 16 oranges were sold (Difference  $15 - 16 = -1$ ).

Table: Activity

Column Name	Type
player_id	int
device_id	int
event_date	date
games_played	int

(player\_id, event\_date) is the primary key of this table. This table shows the activity of players of some games.

Each row is a record of a player who logged in and played a number of games (possibly 0) before logging out on someday using some device.

Write an SQL query to report the fraction of players that logged in again on the day after the day they first logged in, rounded to 2 decimal places. In other words, you need to count the number of players that logged in for at least two consecutive days starting from their first login date, then divide that number by the total number of players.

The query result format is in the following example.

Input: Activity

table:

player_id	device_id	event_date	games_played
1	2	2016-03-01	5
1	2	2016-03-02	6
2	3	2017-06-25	1
3	1	2016-03-02	0
3	4	2018-07-03	5

Output:

fraction
0.33

Explanation:

Only the player with id 1 logged back in after the first day he had logged in so the answer is  $1/3 = 0.33$

**Q44.**

Table: Employee

Column Name	Type
id	int
name	varchar
department	varchar
managerId	int

id is the primary key column for this table.

Each row of this table indicates the name of an employee, their department, and the id of their manager.

If managerId is null, then the employee does not have a manager.No

employee will be the manager of themselves.

Write an SQL query to report the managers with at least five direct reports.Return the result table in any order.

The query result format is in the following example.

Input: Employee

table:

id	name	department	managerId
101	John	A	None
102	Dan	A	101
103	James	A	101
104	Amy	A	101
105	Anne	A	101
106	Ron	B	101

Output:

name
John

**Q45.**

Table: Student

Column Name	Type
student_id	int
student_name	varchar
gender	varchar
dept_id	int

student\_id is the primary key column for this table.

dept\_id is a foreign key to dept\_id in the Department tables.

Each row of this table indicates the name of a student, their gender, and the id of their department.

Table: Department

Column Name	Type
dept_id	int
dept_name	varchar

dept\_id is the primary key column for this table.

Each row of this table contains the id and the name of a department.

Write an SQL query to report the respective department name and number of students majoring in each department for all departments in the Department table (even ones with no current students). Return the result table ordered by student\_number in descending order. In case of a tie, order them by dept\_name alphabetically. The query result format is in the following example.

```
ANS: SELECT d.dept_name, COUNT(s.student_id) AS student_number
FROM Department d
LEFT JOIN Student s ON d.dept_id = s.dept_id
GROUP BY d.dept_name
ORDER BY student_number DESC, d.dept_name;
```

Input: Student  
table:

student_id	student_name	gender	dept_id
1	Jack	M	1
2	Jane	F	1
3	Mark	M	2

Department table:

dept_id	dept_name
1	Engineering
2	Science
3	Law

Output:

dept_name	student_number
Engineering	2
Science	1
Law	0

**Q46.**

Table: Customer

Column Name	Type
customer_id	int
product_key	int

There is no primary key for this table. It may contain duplicates.  
product\_key is a foreign key to the Product table.

Table: Product

Column Name	Type
product_key	int

product\_key is the primary key column for this table.

Write an SQL query to report the customer ids from the Customer table that bought all the products in the Product table.

Return the result table in any order.

The query result format is in the following example.

```
ANS: SELECT c.customer_id
FROM Customer c
WHERE NOT EXISTS (
  SELECT p.product_id
  FROM Product p
  WHERE NOT EXISTS (
    SELECT o.order_id
    FROM Orders o
    WHERE o.customer_id = c.customer_id
    AND o.product_id = p.product_id
  )
);
```

Input: Customer  
table:

customer_id	product_key
1	5
2	6
3	5
3	6
1	6

Product table:

product_key
5

6
---

Output:

customer_id
1
3

Explanation:

The customers who bought all the products (5 and 6) are customers with IDs 1 and 3.\

**Q47.**

Table: Project

Column Name	Type
project_id	int
employee_id	int

(project\_id, employee\_id) is the primary key of this table. employee\_id is a foreign key to the Employee table.

Each row of this table indicates that the employee with employee\_id is working on the project with project\_id.

Table: Employee

Column Name	Type
employee_id	int
name	varchar
experience_years	int

employee\_id is the primary key of this table.

Each row of this table contains information about one employee.

Write an SQL query that reports the most experienced employees in each project. In case of a tie, report all employees with the maximum number of experience years.

Return the result table in any order.

The query result format is in the following example.

ANS: WITH ProjectExperience AS (

```
SELECT
    project_id,
    MAX(experience_years) AS max_experience_years
FROM Employee
GROUP BY project_id
```

)

```
SELECT
    e.project_id,
    e.employee_id,
    e.experience_years
FROM Employee e
JOIN ProjectExperience pe
ON e.project_id = pe.project_id
WHERE e.experience_years = pe.max_experience_years
ORDER BY e.project_id, e.employee_id;
```

Input: Project

table:

project_id	employee_id
1	1
1	2
1	3

2	1
2	4

Employee table:

employee_id	name	experience_years
1	Khaled	3
2	Ali	2
3	John	3
4	Doe	2

Output:

project_id	employee_id
1	1
1	3
2	1

Explanation:

Both employees with id 1 and 3 have the most experience among the employees of the first project. For the second project, the employee with id 1 has the most experience.

**Q48.**

Table: Books

Column Name	Type
book_id	int
name	varchar
available_from	date

book\_id is the primary key of this table.

Table: Orders

Column Name	Type
order_id	int
book_id	int
quantity	int
dispatch_date	date

order\_id is the primary key of this table.

book\_id is a foreign key to the Books table.

Write an SQL query that reports the books that have sold less than 10 copies in the last year, excluding books that have been available for less than one month from today. Assume today is 2019-06-23.

Return the result table in any order.

The query result format is in the following example.

```
ANS: SELECT book_id, name
FROM Books
WHERE publish_date <= DATE_SUB('2019-06-23', INTERVAL 1 MONTH)
AND book_id NOT IN (
    SELECT b.book_id
    FROM Books b
    JOIN Orders o ON b.book_id = o.book_id
    WHERE o.order_date >= DATE_SUB('2019-06-23', INTERVAL 1 YEAR)
```

```
GROUP BY b.book_id  
HAVING SUM(o.quantity) >= 10  
);
```

Input:

Books table:

book_id	name	available_from
1	"Kalila And Demna"	2010-01-01
2	"28 Letters"	2012-05-12
3	"The Hobbit"	2019-06-10
4	"13 Reasons Why"	2019-06-01
5	"The Hunger Games"	2008-09-21

**Q49.**

Table: Enrollments

Column Name	Type
student_id	int
course_id	int
grade	int

(student\_id, course\_id) is the primary key of this table.

Write a SQL query to find the highest grade with its corresponding course for each student. In case of a tie, you should find the course with the smallest course\_id.

Return the result table ordered by student\_id in ascending order. The query result format is in the following example.

```
WITH StudentGrades AS (
  SELECT
    student_id,
    MAX(grade) AS highest_grade
  FROM Courses
  GROUP BY student_id
)
```

```
SELECT
  sg.student_id,
  c.course_id,
  sg.highest_grade
FROM StudentGrades sg
JOIN Courses c
ON sg.student_id = c.student_id AND sg.highest_grade = c.grade
ORDER BY sg.student_id ASC, c.course_id ASC;
```

Input: Enrollments  
table:

student_id	course_id	grade
2	2	95
2	3	95
1	1	90
1	2	99

3	1	80
3	2	75
3	3	82

Output:

student_id	course_id	grade
1	2	99
2	2	95
3	3	82

**Q50.**

Table: Teams

Column Name	Type
team_id	int
team_name	varchar

team\_id is the primary key of this table.

Each row of this table represents a single football team.

Table: Matches

Column Name	Type
match_id	int
host_team	int
guest_team	int
host_goals	int
guest_goals	int

match\_id is the primary key of this table.

Each row is a record of a finished match between two different teams.

Teams host\_team and guest\_team are represented by their IDs in the Teams table (team\_id), and they scored host\_goals and guest\_goals goals, respectively.

The winner in each group is the player who scored the maximum total points within the group. In the case of a tie, the lowest player\_id wins.

Write an SQL query to find the winner in each group. Return the result table in any order.

The query result format is in the following example.

```
ANS: WITH GroupResults AS (
    SELECT
        m.match_id,
        t.group_id,
        CASE
            WHEN t.team_id = m.host_team THEN m.host_goals
            ELSE m.guest_goals
        END AS team_goals,
        CASE
            WHEN t.team_id = m.host_team THEN m.guest_goals
            ELSE m.host_goals
        END AS opponent_goals
    FROM Matches m
    JOIN Teams t
    ON m.host_team = t.team_id OR m.guest_team = t.team_id
)

SELECT
    g.group_id,
    CASE
        WHEN r.team_goals > r.opponent_goals THEN t.team_id
        ELSE
```

```

CASE
  WHEN r.team_goals < r.opponent_goals THEN o.team_id
  ELSE
    CASE
      WHEN t.team_id < o.team_id THEN t.team_id
      ELSE o.team_id
    END
  END
END AS winner
FROM (
  SELECT
    gr.group_id,
    gr.match_id,
    MAX(gr.team_goals - gr.opponent_goals) AS max_points
  FROM GroupResults gr
  GROUP BY gr.group_id, gr.match_id
) AS max_points_table
JOIN GroupResults r
ON max_points_table.group_id = r.group_id AND max_points_table.match_id =
r.match_id
JOIN Teams t
ON r.team_goals > r.opponent_goals AND (t.team_id = r.match_id.host_team OR t.team_id
= r.match_id.guest_team)
JOIN Teams o
ON r.opponent_goals > r.team_goals AND (o.team_id = r.match_id.host_team OR
o.team_id = r.match_id.guest_team)
GROUP BY g.group_id;

```

Input: Players  
table:

player_id	group_id
15	1
25	1
30	1
45	1
10	2
35	2
50	2
20	3
40	3

Matches table:

match_id	first_player	second_player	first_score	second_score
----------	--------------	---------------	-------------	--------------

1	15	45	3	0
2	30	25	1	2
3	30	15	2	0
4	40	20	5	2
5	35	50	1	1

Output:

group_id	player_id
1	15
2	35
3	40
